USABILITY RESEARCH REPORT

Usability Testing & Analysis

Project: Campus Connect – College Events App

Project	Campus Connect – College Events App
Testing method	Task-based usability testing
Target audience	College students
Sample	5 fictional participants; simulated results
Platform	Figma interactive prototype
Session duration	Estimated 10–15 minutes per participant

Report overview

This report outlines the usability objectives, task scenarios, simulated participant outcomes, key findings, and design recommendations for Campus Connect. The sample data is illustrative and is included to demonstrate how usability metrics can be recorded and interpreted.

1. Introduction

Campus Connect is a college event management application designed to help students discover upcoming college events, view event details, register for events, and track their registrations. The purpose of this usability testing exercise is to evaluate how easily students can interact with the application, identify potential usability problems, and suggest improvements to enhance the user experience.

2. Objectives

• Evaluate the ease of navigation across the application.
• Understand whether users can discover and register for events.
• Identify confusing interface elements.
• Measure task completion time and success rate.
• Suggest improvements based on the observations.

3. Testing Methodology

Testing element	Description
Testing method	Task-based usability testing
Target audience	College students
Sample size	5 fictional participants (simulated data)
Testing platform	Figma interactive prototype
Session duration	Estimated 10–15 minutes per participant
Metrics	Task completion rate, task completion time, number of errors, and user satisfaction score (1–5)

4. Test Scenarios

Participants were given the following tasks. Each task was evaluated against its expected outcome.

Task No.	Scenario	Expected result
1	Find an upcoming college event.	Successfully locate an event.
2	View the event details.	Understand the date, time, and venue.
3	Register for an event.	Complete the registration process.
4	Check registration confirmation.	Identify successful registration.
5	Find registered events.	Locate the My Events section.

5. Participant Data

The following five participants and their results are fictional examples.

Participant	Tasks completed (out of 5)	Average satisfaction
P1	5	5/5
P2	4	4/5
P3	4	4/5
P4	3	3/5
P5	5	5/5

6. Sample Task Completion Analysis

Task	Successful participants	Completion rate
Find an event	5/5	100%
View event details	5/5	100%
Register for an event	4/5	80%
Check confirmation	4/5	80%
Find My Events	3/5	60%

21 / 25	84%
Successful task completions	Overall completion rate

Overall completion rate = 21 successful task completions out of 25 attempts = 84%.

7. Observations and Feedback

The observations below are illustrative examples, not actual participant statements.

Participant	Sample observation
P1	Navigated through the application easily and completed all tasks.
P2	Needed some time to understand the registration process.
P3	Found the event details page easy to understand.
P4	Had difficulty locating the My Events section.
P5	Completed all tasks without major difficulties.

Common potential usability issues

1. Some users may take time to locate the registration option.
2. The My Events section may not be immediately noticeable.
3. Users may need clearer confirmation after registering.
4. Small text and compact buttons may affect readability and interaction.

8. Key Findings

Based on the simulated results:

• Event discovery and viewing event details were the easiest tasks, with 100% completion.
• Event registration had an 80% completion rate.
• Locating registered events was the most challenging task, with a 60% completion rate.
• The overall task completion rate was 84%.
• The average satisfaction score was 4.2 out of 5.

These results suggest that event discovery is relatively straightforward, while registration and post-registration navigation could benefit from improvements.

9. Design Improvement Suggestions

Identified issue	Suggested improvement	Priority
Registration option may be difficult to locate.	Use a prominent Register Now button.	High
My Events section is not easily noticeable.	Improve its visibility in navigation.	High
Confirmation may not be sufficiently clear.	Display a clear success message after registration.	High
Small text may affect readability.	Increase font size and improve spacing.	Medium
Event discovery could be more flexible.	Add categories and filtering options.	Medium

10. Iterative Design Improvement

The following process can be followed to improve Campus Connect:

1. Identify usability issues from the testing results.
2. Prioritise problems based on their impact on users.
3. Modify the relevant Figma screens.
4. Conduct another round of usability testing.
5. Compare the new results with the previous results.
6. Make further improvements if necessary.

11. Conclusion

The sample usability analysis demonstrates how usability testing can help evaluate the effectiveness of the Campus Connect application. The simulated results indicate that users can discover and view events easily, but the registration process and My Events navigation may require further improvements.

By applying user-centred design principles and conducting iterative usability testing, Campus Connect can become more intuitive, accessible, and efficient for college students.

Expected Learning Outcome

This exercise demonstrates the importance of usability metrics, task-based testing, user feedback analysis, and iterative design improvements in developing an effective user interface.
